Appendix 1
This appendix was part of the submitted manuscript and has been peer reviewed. It is posted as supplied by the authors.

Appendix 1. *Current and projected disability adjusted life years (DALYs) in chronic disease in Australia*

While per patient diabetes complications outcomes are improving compared with the general population, diabetes as a diagnosis is increasing in the general population, as is longevity, leading to increased numbers with diabetes. As a result, disability adjusted life years (DALYs) are projected to rise in diabetes resulting in the highest national disability score for any chronic illness from ~2016 onwards. Notably, another ageing related disease, of dementia, is also increasing (Source: Australian Institute of Health and Welfare Burden of Disease Database; ⁸).
